BSc Computer Science, Brunel University London | First Class Honours | Graduated Jul 2026

SUMMARY

Founded and ran WebSprint through three years of university, handling client relationships, leading a development team, and shipping production systems across the full stack, including infrastructure and AI tooling. Now also working part-time as a Technology Associate at DigiSci Consulting, leading website delivery, IT administration, and internal AI tooling for the firm. What keeps it interesting is the shift between understanding what a client or business actually needs and figuring out how to build it well, often in the same afternoon. That rhythm shaped how I work: most effective when technical depth and clear communication have to operate together, and drawn to problems where challenging the obvious approach is genuinely worth doing. Looking for a focused engineering role where I can go deeper on the craft.

WORK EXPERIENCE

WebSprint (below) ran continuously alongside every role that follows.

Full-Stack Developer (Founder) • WebSprint

Sep 2023 – Present

London, Hybrid

- Self-managed production infrastructure on Proxmox using Docker, microservices, Cloudflare Zero Trust, and Linux, reducing cloud spend by **35%**; deployed local LLM inference via Ollama (Gemma 3, Qwen 3, Llama 3.2) behind a FastAPI RESTful API, cutting AI delivery costs **50%** vs. cloud equivalents
- Built GitHub Actions CI/CD pipeline implementing continuous integration and continuous deployment (push → container restart → health check → failure alert), eliminating manual deployments and enabling same-day releases across client environments
- Retained **three of four paying clients for an average of 14 months**, now supporting five active client engagements end-to-end, delivering full-stack products across React, Next.js, TypeScript, Flask, and Firebase, taking full ownership of scope, architecture, and delivery without a separate PM or QA layer
- Hired and directed cross-functional project teams of **6+** per engagement, including technical leads, product managers, designers, and developers, delivering all five client projects to production on agreed scope and timeline
- Maintained automated testing suites (pytest, Jest) across FastAPI services and React components, covering critical API contracts and UI state logic; tests ran as a **required CI gate** before any production merge

Technology Associate (Part-Time) • DigiSci Consulting

Jun 2026 – Present

Remote

- Led design-to-build delivery and full page-by-page copywriting of the firm's corporate website (live since **Jul 2026**), covering page architecture, CMS configuration, third-party integrations, SEO metadata, and responsive design
- Commissioned and ran an AI-orchestrated, **five-persona** QA review ahead of launch, scoring the site against a fixed evaluation framework across **three review cycles** and surfacing **15 priority fixes** before go-live
- Designed and built the firm's internal AI-assisted workspace, a prototype “operating system” for day-to-day work, including a working proposal, initial build, and a documented SOP, achieving **full team-wide adoption**
- Independently assessed a prospective AI knowledge-management vendor's proposed integration, judging it suitable for information retrieval but not yet safe for autonomous actions, and recommended an integrity check and human-approval gate before adoption
- Built the firm's LinkedIn presence from scratch, including the company page, launch assets, and a content-calendar workflow with a **22-point performance rubric**, and led the web domain transfer to a UK registrar, resolving a recurring DNS discrepancy affecting the live site and email routing
- Own IT administration for **12 devices** across laptops, desktops, VMs, and mobile (account provisioning, software access, device security), and built an internal task-management workflow with defined escalation rules for Founder sign-off

Technology Intern • adthera bio

Jul 2024 – Sep 2024

Birmingham, Hybrid

- Designed, built, tested, and deployed adthera.bio end-to-end in Next.js with Sanity CMS in **under 2 weeks**, a full design-to-production cycle; handoff to an active maintenance contract has remained in place for **12+ months**, validating delivery quality alongside delivery speed

Lead Software Engineer • Brunel Talent Marketplace

Nov 2023 – Jan 2024

London, Hybrid

- Led a team of **4-5 engineers** building a React Native + Firebase tablet survey app for the university psychology department, shipped for deployment on an international field expedition
- Evaluated React Native, Flutter, and native Android Studio for the project stack; recommended React Native on cross-platform efficiency, team JavaScript familiarity, and timeline grounds. The recommendation was accepted and the app shipped on schedule
- Defined and enforced Git branching conventions and codebase structure standards across a **12-developer team** organized into subdivisions, leading the mobile frontend division (three developers, one designer) and coordinating with other division leads to unblock parallel development on a shared codebase

Junior Software Engineer • Autolomous

Jun 2023 – Aug 2023

London, Hybrid

- Delivered conditional rendering for an internal low-code builder in TypeScript/Angular, adding conditional UI states driven by active builder configuration, merged into the production tool used across the engineering team
- Refactored front-end component architecture across multiple builder sections, eliminating redundant render paths and standardising state handling across the UI

EDUCATION

Brunel University London • Computer Science with Software Engineering BSc

Sep 2023 – Jul 2026

First Class Honours (1st)

Final Year Project: AI Flashcard Generator, a multi-model pipeline (TinyLlama, Gemma 3, Qwen 3 via Ollama) routing generation tasks by prompt complexity, token budget, and model capability to balance output quality against inference cost, with a FastAPI backend, MongoDB, and Next.js frontend. Built to run entirely on local inference, eliminating cloud API dependency. github.com/kar-kit/FYP26-Frontend

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, Java, C#, object-oriented programming

Frameworks: React, Next.js, Angular, React Native, Flask, Express, Node.js

Databases: MySQL, PostgreSQL, MongoDB, Firebase

Cloud & DevOps: GitHub Actions, CI/CD, Docker, microservices, Proxmox, GCP, AWS, Cloudflare Zero Trust, Linux

Tools: RESTful APIs, Git, FastAPI, code review, Agile, Scrum, Jest, pytest, SDLC, version control, Jira, Figma, Sanity CMS, Ollama

AI / ML: Claude API, OpenAI API, Local LLM Inference, multi-model task routing, structured output extraction, tool-calling, Ollama (Gemma 3, Qwen 3, Llama 3.2, TinyLlama)
